Exercise 01 Report

Question: Briefly describe how the pragma omp barrier command works in this program.

Answer: The #pragma omp barrier directive synchronizes all threads in the current team. When a thread reaches this barrier, it waits until all other threads in the team have also reached it. In this program, all threads will print their first message, wait at the barrier, and only after all threads have completed their first print will they proceed to print the messages after the barrier.
